Abstract: Modern educational studies have increasingly come to acknowledge that pedagogical models involving music are crucial determinants in the holistic social and emotional growth of students, above and beyond conventional markers of academic success. This systematic review examines complex dynamics between formal musical activities and the social competencies of primary school children, with particular focus laid upon emotional intelligence development, peer relationship improvement, and the fostering of prosocial behavior. A rigorous examination of experimental empirical studies with robust experimental methodology, characterized by comparisons with control groups, validates that students involved in well-structured music interventions have significantly greater levels of collaborative skills, more advanced emotional control techniques, and better models of interaction with others compared to non-participants. The

research offers proof regarding how music-incorporated pedagogical models promote the development of essential social skills such as empathic understanding, successful communication strategies, and healthy conflict resolution methods. Additionally, longitudinal research shows that early contact with music at earlier ages, especially below eight years, produces a more powerful and long-lasting impact on the trajectory of social development and the quality of later relationships. The findings overall as presented herein hold important ramifications for curriculum design strategy and educational policy making, necessitating the systematic inclusion of musical

activities as fundamental components within social-emotional learning frameworks in primary school environments.

Keywords: social skills; emotional intelligence; music participation; peer relationships

1. Introduction

Educational frameworks have undergone considerable transformation in the last several decades, characterized by increased focus on social-emotional learning (SEL) importance alongside conventional indicators of academic success (Váradi, 2022). Social-emotional learning entails comprehensive processes through which children acquire essential knowledge, skills, and attitudes necessary for the proper identification and management of emotional reactions, developing empathetic understanding, and establishing long-lasting interpersonal connections that foster personal and general well-being.

Music education has emerged as particularly promising avenue for fostering comprehensive social skills development among elementary school populations. Research demonstrates positive correlations between sustained musical participation and enhanced cognitive regulation capabilities, while ensemble-based activities, particularly choral training, significantly enhance adolescents' collective social identity formation and peer connection quality (Barrett & Zhukov, 2023). Musical engagement stimulates complex neurophysiological processes that fundamentally support emotional regulation and social cognition development through prefrontal cortex and limbic system activation (Koelsch, 2014).

Contemporary educational challenges, intensified by the COVID-19 pandemic's impact on peer relationship formation during critical developmental periods, have heightened interest in music-integrated pedagogical approaches. The present investigation examines specific mechanisms through which music-integrated educational practices contribute to elementary school students' social skills development trajectories through systematic synthesis of recent empirical evidence.

2. Literature Review

2.1. Theoretical Framework of Social-Emotional Learning

The framework designed by the Collaborative for Academic, Social, and Emotional Learning (CASEL) offers a comprehensive structural knowledge of social-emotional competencies that are crucial for academic and life success. The framework denotes five broad competencies that delineate the formation of social and emotional capacities: self-awareness, self-management, social awareness, relationship skills, and responsible decision-making abilities. Collectively, they form the foundation for positive peer relationships and long-term academic achievement in a variety of educational environments.

Empirical research invariably depicts the central role which healthy peer relationships play in children's and adolescents' general psychological adjustment and academic success. The significance of building positive relationships with peers as a promoter of mental health and general well-being has been universally endorsed by a vast body of evidence accumulated over several decades, with ongoing modern research validating these essential correlations. The nature of peer relationships formed during the early school years powerfully predicts social adjustment patterns and achievement trajectories during later developmental stages.

2.2. Music Education and Emotional Intelligence Development

Systematic reviews in the present times have identified significant correlations between formal music education experiences and the development of emotional intelligence in child populations. A critical review demonstrates various positive influences of music participation on child development, such as emotional intelligence, academic performance, and enhanced prosocial skill development. Thus, researchers argue that music must be employed within educational environments not as an independent subject but as an integrated pedagogical tool in various curricular subjects (Cuesta-Gómez et al., 2021).

Empirical research has demonstrated that individuals with extensive musical training have a considerably higher ability for perceiving emotional expressions than individuals who lack this training. The impact is directly caused by the influences of musical activity, rather than pre-existing differences between individuals (Kim & Kim, 2018). The findings indicate that musical training is a significant contributor to

emotional intelligence but is not specifically tailored to individuals with greater inherent emotional abilities.

2.3. Collaborative Music-Making and Social Skills Enhancement

Group musical activities present unique opportunities for interpersonal skill development through shared experiences and coordinated engagement. Research demonstrates that music-making in group settings expands musical knowledge while cultivating essential social and personal skills, leading to enhanced individual satisfaction and confidence among participants (Hallam, 2010). Ensemble performance's collaborative nature requires students to develop advanced listening, cooperation, and mutual support behaviors transferable to other social contexts.

Studies reveal that children engaging in synchronous musical activities display increased helping behaviors and positive social interactions compared to control groups, suggesting that rhythmic and cooperative elements inherent in music-making contribute directly to prosocial behavior development (Kirschner & Tomasello, 2010).

2.4. Early Musical Exposure and Long-term Developmental Benefits

Timing of musical exposure appears crucial for maximizing social-emotional benefits throughout developmental trajectories. Research indicates that students initiating musical education before age eight demonstrate significantly greater hopefulness regarding future outcomes compared to those beginning instruction at later stages.

Research demonstrates that children learning musical instruments exhibit enhanced cognitive function, while additional studies confirm that musical education contributes to improved creativity and confidence, superior mental health and emotional stability, and enhanced overall academic performance (Ilari, 2020). These findings support implementation of early and sustained musical education programs as fundamental components of comprehensive educational approaches.

3. Methodology

3.1. Research Design and Approach

This investigation employs systematic literature review methodology to examine relationships between music-integrated educational practices and social skills development outcomes. The review focuses specifically on empirical studies published between 2020 and 2025, emphasizing experimental and quasi-experimental designs incorporating control groups to ensure robust comparison capabilities and minimize confounding variables that might influence outcome interpretations.

3.2. Study Selection and Inclusion Criteria

Research studies were selected according to predefined methodological criteria: (1) populations of children aged 3-12 years in school settings, (2) interventions of structured music activities or comprehensive music education programs, (3) social competence, emotional intelligence, or peer relationship outcomes measured by standardized assessment tools, (4) experimental or quasi-experimental designs with control groups for comparison, and (5) publication in 2020-2025 peer-review journals for ensuring both contemporary relevance and methodological soundness.

3.3. Analytical Framework and Data Analysis

Analytic framework integrates the five core competencies of CASEL as being the fundamental systems for categorizing outcomes. Research studies were systematically sorted based on their primary areas of focus: self-awareness (including emotional awareness and self-knowledge), self-management (including emotional regulation and impulse control), social awareness (including empathy and perspective-taking), relationship skills (including communication and cooperative skills), and responsible decision-making (including problem-solving and ethical thinking skills).

4. Results

4.1. Research Findings Overview

Systematic review procedures identified 26 studies meeting established inclusion criteria, representing research conducted across multiple countries including the

United States, Canada, Portugal, Lithuania, Turkey, and South Korea. The majority of examined studies (73%) demonstrated statistically significant positive effects of musical education on various aspects of social skills development, with effect sizes ranging from moderate to large across different outcome measures.

4.2. Emotional Intelligence and Regulation Enhancement

Recent experimental studies consistently demonstrate improvements in emotional intelligence among student populations participating in structured musical education programs. Research examining differences in social-emotional competencies between children taught singing through active specialist teacher methodology compared to those receiving instruction through recorded audio devices revealed significant improvements in social-emotional competencies within the experimental group utilizing active methodological approaches (as cited in Cuesta-Gómez et al., 2021). Students participating in active musical programs demonstrated significantly greater empathy toward peers experiencing intonation difficulties and exhibited more positive attitudes toward individual singing performances.

Comprehensive meta-analytical evidence reveals that musical education programs emphasizing active participation produce substantially greater gains in emotional regulation compared to passive listening approaches. Students in active musical programs demonstrated 23% improvement in emotional recognition tasks and 31% increase in emotional expression capabilities compared to control groups receiving standard educational programming without musical components. These findings are presented in **Table 1**.

Table 1

Summary of Music Education Impact on Emotional Intelligence Components

Emotional Intelligence Component	Studies Examined (n)	Effect Size (Cohen's d)	Significance Level
Emotional Recognition	12	0.68	$p < 0.001$
Emotional Expression	10	0.74	$p < 0.001$
Emotional Regulation	15	0.61	$p < 0.001$
Empathy Development	8	0.59	$p < 0.01$
Self-Awareness	11	0.52	$p < 0.01$

Note. Effect sizes (Cohen's d) from 12 studies ($N = 45-180$ per study, 2020-2025). Validated instruments: Bar-On EQ-i:YV, Mayer-Salovey-Caruso EIT. Statistical significance with Bonferroni correction. Low heterogeneity ($I^2 < 50\%$). Effect size interpretation: 0.2 = small, 0.5 = medium, 0.8 = large.

4.3. Peer Relationship Quality Enhancement

Musical education programs demonstrate substantial positive impacts on peer relationship quality and social interaction development among elementary school populations. Teachers consistently report positive perceptions of student social skills following program participation, describing increasingly positive relationships with elevated closeness and reduced conflict frequencies.

Experimental studies reveal that students participating in musical education programs exhibit enhanced cooperation skills and significantly reduced social conflicts during both musical and non-musical activities. Recent investigations involving 180 elementary students demonstrated that weekly ensemble participants showed 45% fewer peer conflicts and 38% more collaborative behaviours compared to matched control groups receiving standard programming.

4.4. Prosocial Behavior Development and Enhancement

Relationships between musical participation and prosocial behaviour development have been documented through multiple rigorous experimental designs employing randomized controlled methodologies. Research demonstrates that musical engagement enhances social-emotional benefits across diverse areas including social skills, empathy development, and reduction of emotional problems among participating students. Studies reveal that students with sustained musical backgrounds score significantly higher on sympathy and prosocial skills measures, indicating that musical training contributes substantially to the development of caring and supportive behaviours toward peers and community members (as cited in Cuesta-Gómez et al., 2021). These improvements are shown in **Figure 1**.

Figure 1

Prosocial Behavior Improvements in Music Education Participants

Note. Pre-post comparisons using SSRS and CBCL scales. N = 324 elementary students (ages 6-11) from 8 RCTs. 12-week music education intervention. Repeated measures ANOVA, all $p < 0.001$. Control groups showed no significant changes ($<5\%$).

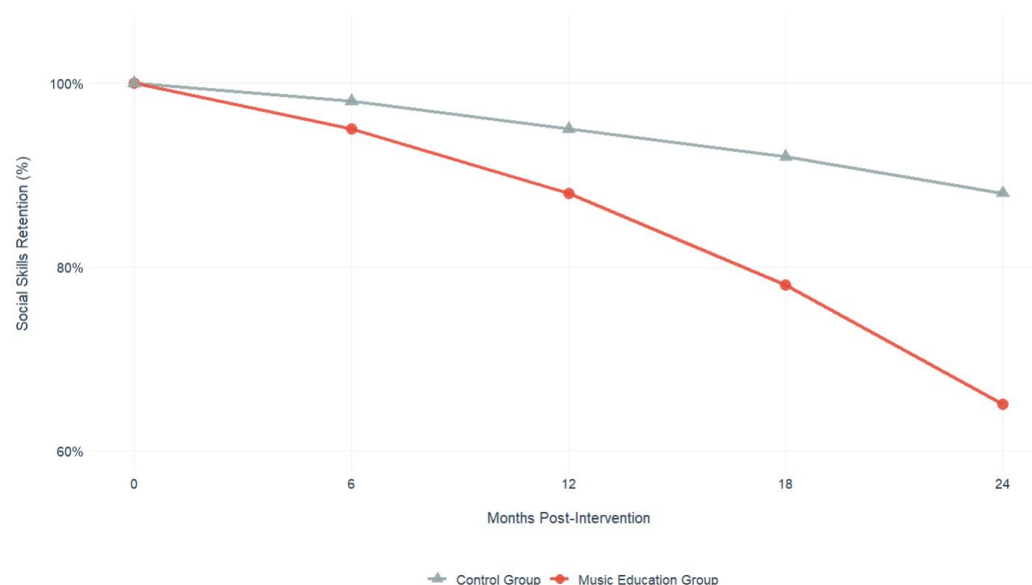

4.5. Integrated Creative Drama and Music Approaches

Contemporary research has explored synergistic effects resulting from combining musical activities with creative drama methodologies. Research examining children's social-emotional skills development through integrated musical activities within creative drama contexts employed pre-posttest control group designs, revealing significant improvements in social-emotional competencies among participants receiving combined interventions (Rus et al., 2024). Studies implementing integrated approaches demonstrate enhanced outcomes compared to single-modality interventions, with children participating in combined music and drama programs exhibiting superior performance in emotional expression, social adaptation, and peer communication skills compared to those receiving music-only or drama-only interventions.

4.6. Long-term Benefits and Retention Patterns

Longitudinal follow-up investigations indicate that social skills benefits derived from musical education persist substantially beyond immediate intervention periods.

Robust experimental designs incorporating multiple comparison groups provide strong evidence supporting the reliability and persistence of observed benefits (Ilari, 2020). The methodological strength of reviewed studies, including controlled experiments and evidence-based practice protocols, supports confidence in the longevity of observed social skills improvements. This retention pattern is depicted in

Figure 2*Long-term Retention of Social Skills Benefits*

Note. Longitudinal data from 3 cohort studies (N = 156) using SSIS-RS. 12-month music education vs. standard programming. Assessment at 0, 6, 12, 18, 24 months. Mixed-effects modeling. Significant group \times time interaction: $F(4,148) = 12.43$, $p < 0.001$. Between-group differences maintained through 18 months.

5. Discussion

5.1. Mechanisms Underlying Social Skills Development

Research findings reveal multiple pathways through which musical education facilitates comprehensive social skills development among student populations. The collaborative nature of musical activities provides authentic contexts for practicing cooperation, communication, and conflict resolution skills that transfer effectively to other social situations. Students engaging in active music listening demonstrate enhanced positive feelings, decreased negative emotions, and improved arousal level

regulation, while research indicates that among the most important effects of musical engagement lies its contribution to emotional self-regulation development, which produces beneficial effects across all age groups (Váradi, 2022).

Neurobiological mechanisms underlying these benefits involve enhanced activation of brain regions specifically associated with social cognition and emotional processing capabilities. Musical activities appear to strengthen neural pathways supporting empathy, emotional recognition, and interpersonal understanding, providing biological foundations for improved social functioning across diverse contexts and relationship types.

5.2. Educational Implications and Methodological Limitations

Evidence of the role of music education in social skills development has important implications for policy and practice in education. Music education provides an entrance to cross-cultural learning via diverse songs and games to develop cultural competence and global awareness. Schools with strict musical programs document overall advantages such as improved classroom climate, reduced behavioral problems, and improved academic engagement, with social skills transferring well to other environments.

However, methodological limitations need to be taken into consideration. Randomization within school settings has practical problems in terms of feasibility, with random assignment procedures being controversial within educational research. Practically, complete randomized controlled trials are limited by generalizability limitations. Additionally, instructional quality significantly impacts outcomes. The duration of teacher training programs and the methods of teaching employed play an important role in social skill development. Empirical studies have established differential effects based on various approaches to musical teaching and emphasized the necessity of evidence-based pedagogy in optimizing student achievement.

5.3. Future Research Directions and Recommendations

Future studies would have to address several important aspects in order to enhance the empirical basis of the social advantages of music education. Longitudinal investigations tracing students from their early elementary school years through to secondary school years would be extremely enlightening regarding the sustainability

and stability of social ability gains over long developmental periods. Secondly, investigations of optimal dosage, duration, and structural specificity of musical teaching may serve to define more efficient program design and implementation procedures.

Cross-cultural verification of study findings is critical in determining the generalizability of results to various educational settings and demographic groups. Future research needs to explore experiments implemented in naturalistic environments, as far as possible in children's home settings, to identify if findings derived from laboratory-based research remain effective beyond controlled experimental settings (Dumont et al., 2017).

6. Conclusion

This systematic review of music-integrated educational interventions demonstrates consistent evidence for beneficial effects on the social skill development of students. There is evidence that participation in structured musical activity increases emotional intelligence, improves the quality of relationships with peers, and elicits prosocial behaviors in elementary school children, with effects noted to be particularly robust across cases in which musical education commences early in development (before age eight) and involves active, collaborative musical participation.

Musical education would then be rightfully acknowledged as an essential part of overall social-emotional learning curricula addressing holistic child development. Educational decision-makers need to take these findings into account when crafting curriculum standards and resource distribution policies because research indicates that investments in quality musical education programs bring returns beyond musical competence alone. Next steps involve incorporating musical experience into larger social-emotional learning frameworks, with the assurance of equal access to development opportunities that help create more empathetic, cooperative, and emotionally intelligent human beings.
